

Getting FHX files to open up as Windows-1252 (ANSI) instead of UTF-8 with BOM

Author: Tyler Drummond

Issue

VSCoDe is set to open FHX files as UTF-8 by default. This doesn't do much to effect the import except around special symbols. Specifically, the degree symbol “°”. This causes it to misread during the import and DeltaV resolves to Â°C or ĩ½C, which results in an import error. This issue does not occur across VBA, notepad++, and FHX Exports.

Fix

- 1) Open VSCode
- 2) Ctrl + Shift + P
- 3) Type “Open User Settings (JSON)” *(This should auto fill at some point)*
- 4) Add a files.associations entry to your settings.json:

```
"files.associations": {  
  "*.fhx": "fhx"  
}
```

- 5) Then, add the language-specific encoding setting for that language ID:

```
"[fhx]": {  
  "files.encoding": "windows1252"  
}
```

- 6) Ctrl + Shift + P again
- 7) Type “Reload Window” and this should fix the issue
